

A small bird, possibly a New Zealand fantail, is perched on a dark brown branch. The bird has a black head and back, a white patch on its wing, and a bright yellow patch on its chest. It is facing right. The background is a soft-focus green, suggesting foliage.

# Motivation

ORIGINALLY A LAND DOMINATED BY BIRDS

“If you can not measure it, you can not improve it.”

(Lord Kelvin)

Source: <http://doc.govt.nz>

# Measuring bird populations

Birds: cryptic beasts

- Dense vegetation
- Well-camouflaged
- Sometimes nocturnal
- Can fly, so can be in hard-to-reach areas

But they make plenty of noise!

Sound courtesy of Alex Brighten

# Call count surveys

24 hours a day

3 months

Analysis is subjective  
and tedious

8 hours a day

2 weeks

Recording is subjective and tedious

# Automated Bird Recognition

WHEN A USER TAKES A PHOTO,  
THE APP SHOULD CHECK WHETHER  
THEY'RE IN A NATIONAL PARK...

SURE, EASY GIS LOOKUP.  
GIMME A FEW HOURS.

... AND CHECK WHETHER  
THE PHOTO IS OF A BIRD.

I'LL NEED A RESEARCH  
TEAM AND FIVE YEARS.

IN CS, IT CAN BE HARD TO EXPLAIN  
THE DIFFERENCE BETWEEN THE EASY  
AND THE VIRTUALLY IMPOSSIBLE.

# It's kind of like speech, but...

## Birds:

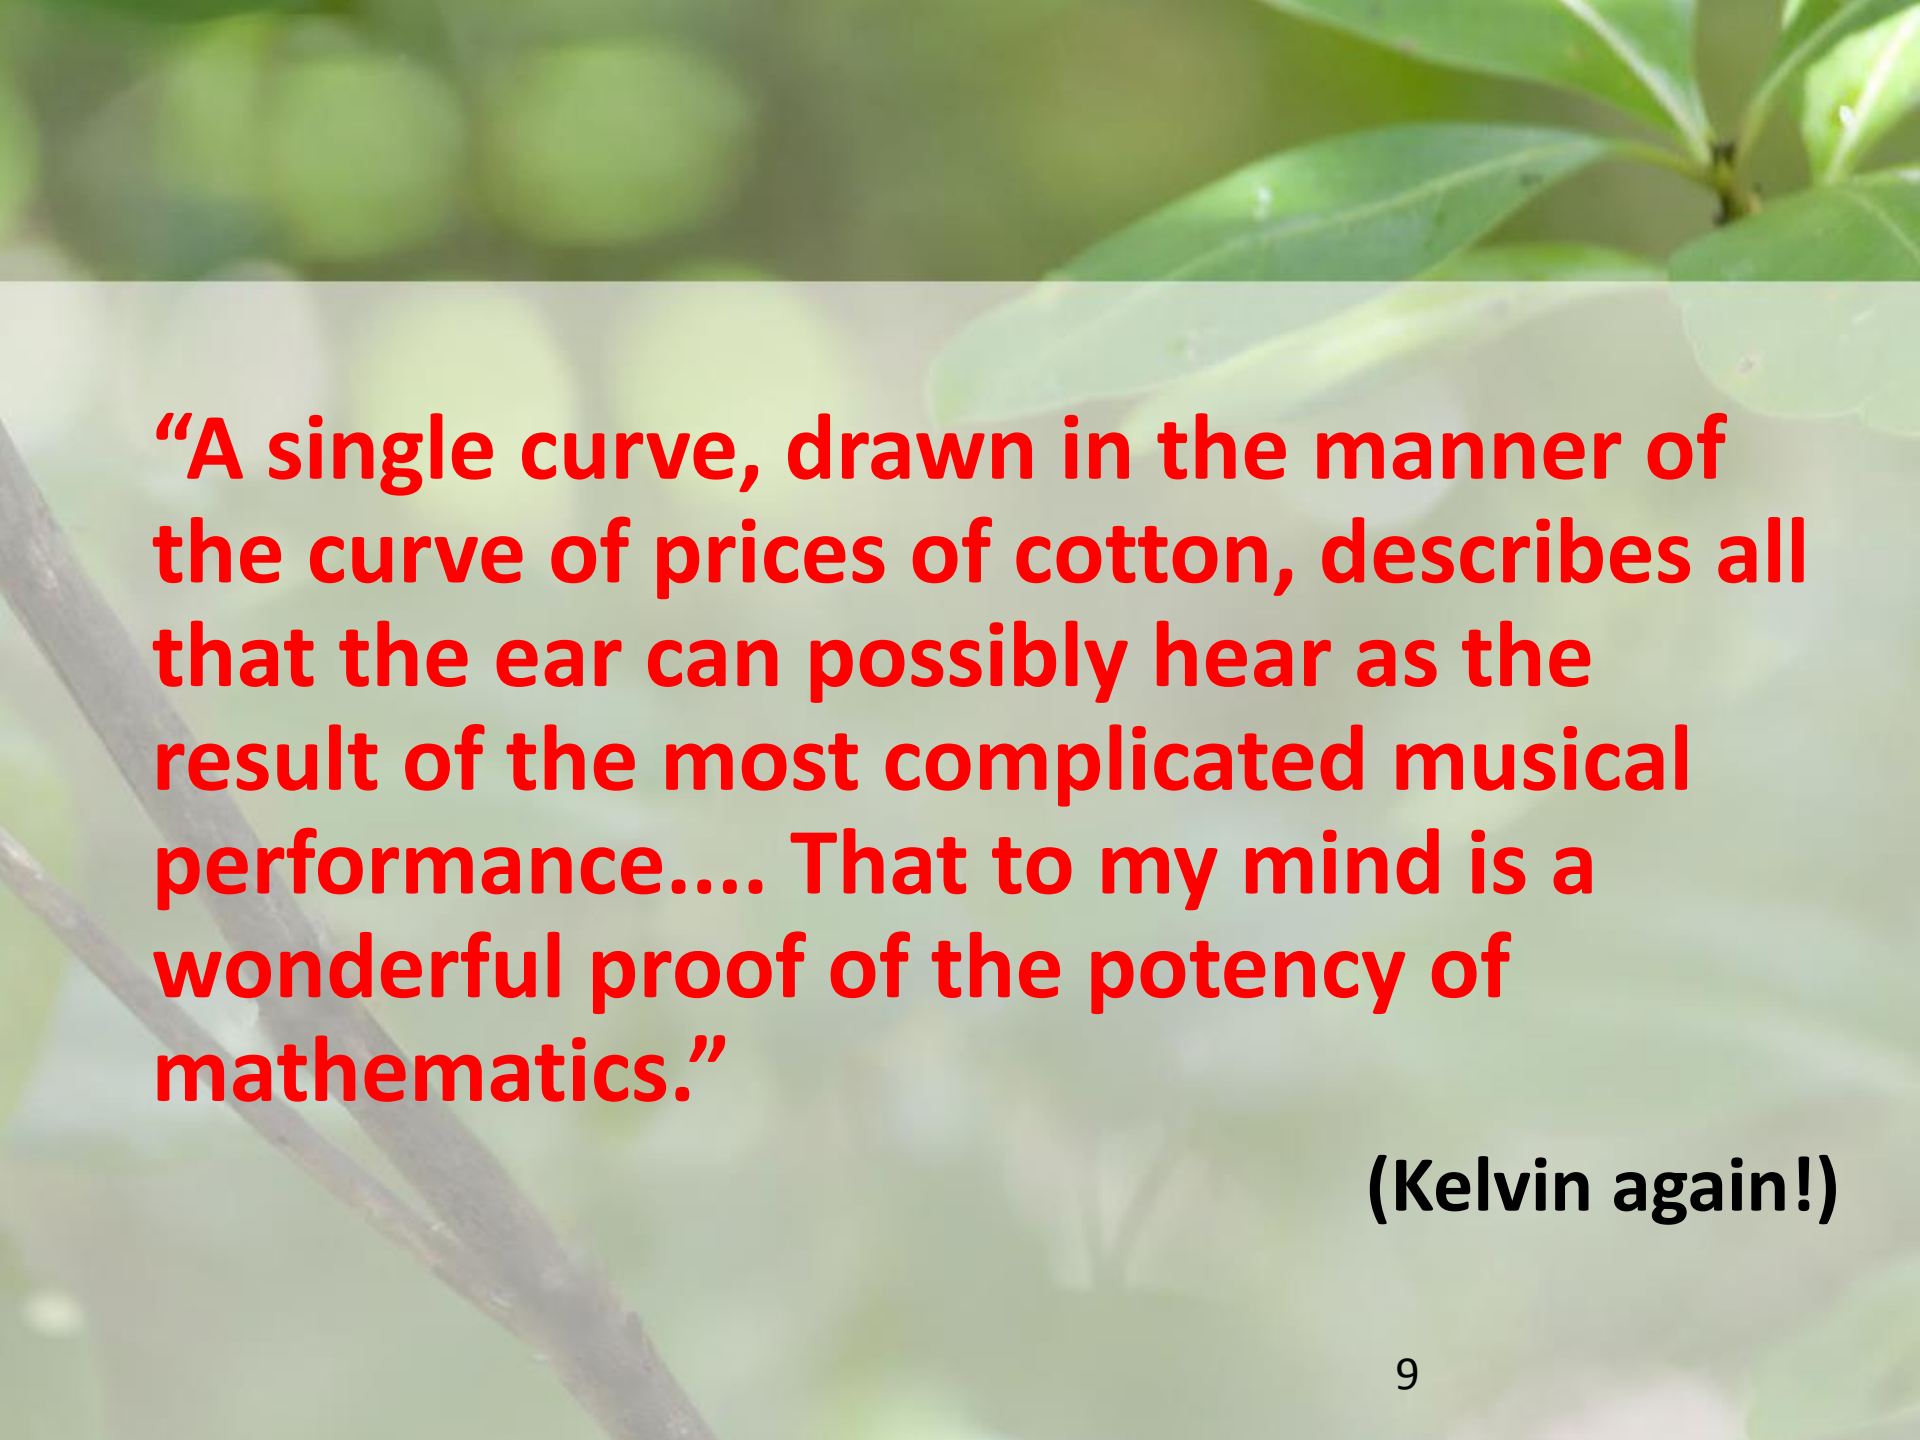

- Won't sing nicely straight into the microphone
- Overlap their calls
- Have large repertoires
- ... and even dialects

## Recordings are:

- Noisy (environmental and recording noise)

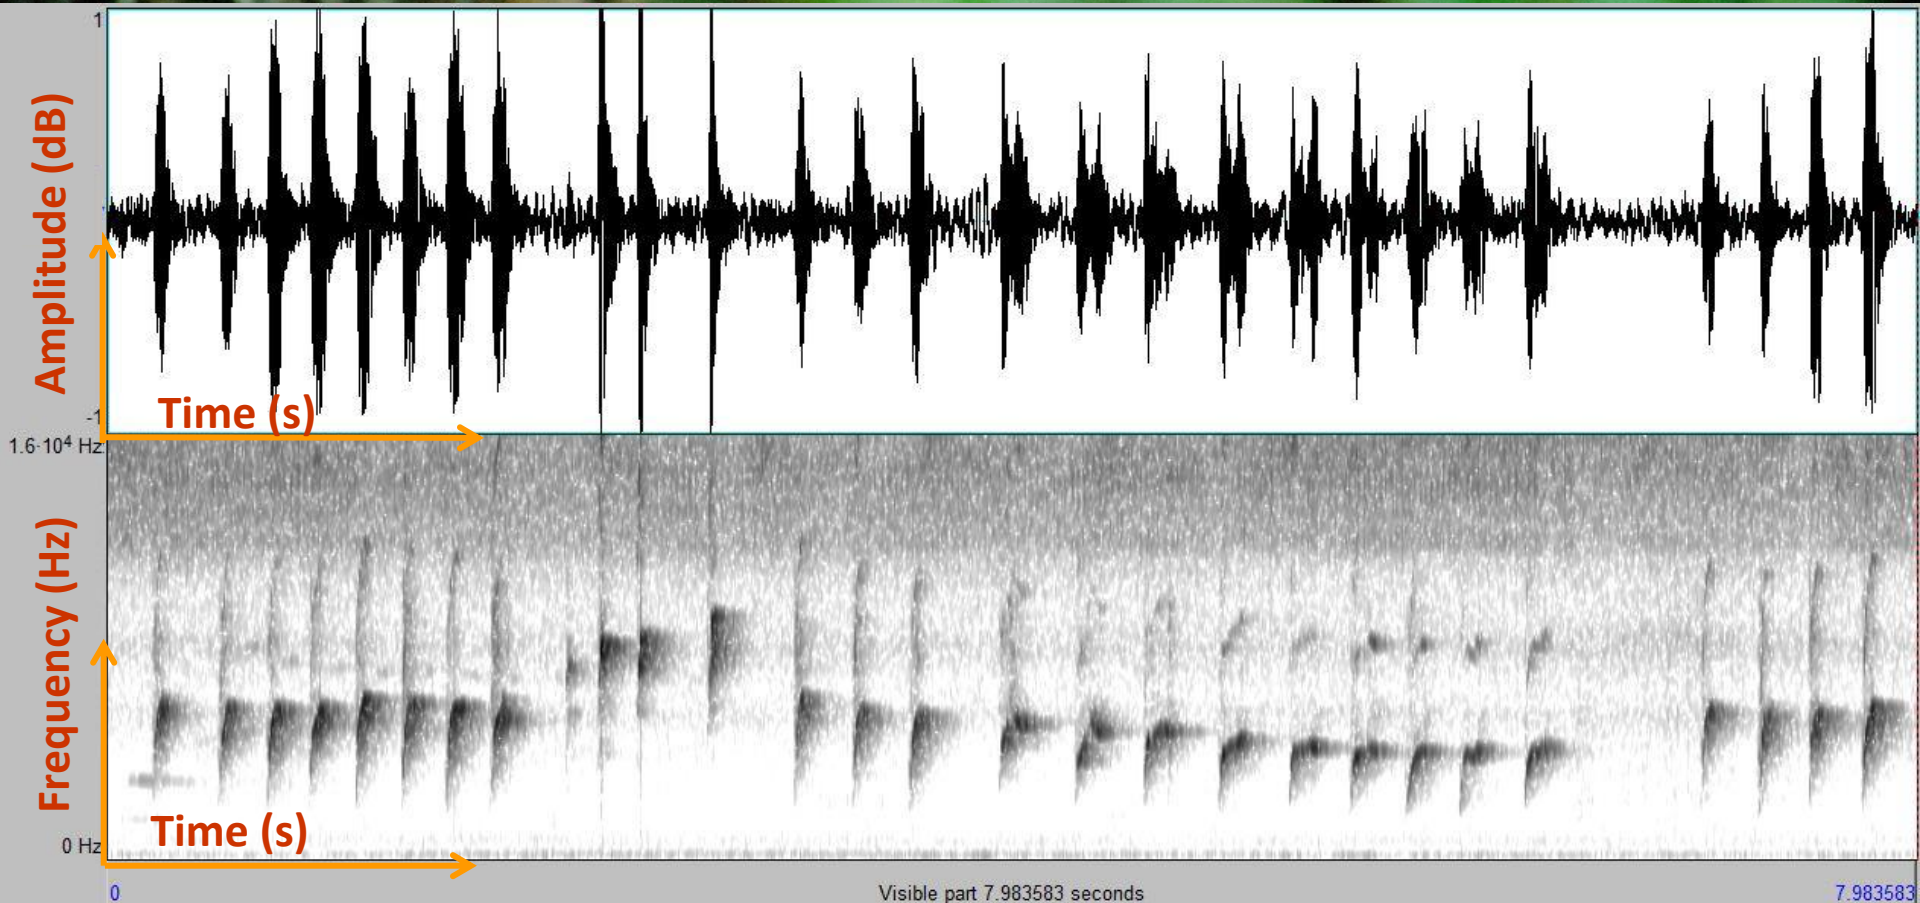

**“A single curve, drawn in the manner of the curve of prices of cotton, describes all that the ear can possibly hear as the result of the most complicated musical performance.... That to my mind is a wonderful proof of the potency of mathematics.”**

**(Kelvin again!)**

# It's kind of like speech, but...

# It's kind of like speech, so...

Bird	No of Ref	No of Test from same source	No of Test from different source	DTW Recognition Rate %	VQ Recognition Rate %
Kiwi	1	4	-	100	100
Morepork	1	3	7	100	100
Bellbird	1	22	18	97.5	77.5
Robbin	1	21	-	95.24	66.6
Tui	1	25	15	90	41.6
				96.55%	77.1 %

Pretty nearly perfect!

Providing numbers of birds are small, sources are clean, data chosen carefully, etc. etc.

## SoundID: At last a sound recognition system that really works!!

SoundID uses all new, effective algorithms to bring you world-class sound detection and recognition . Our system requires only minor tweaking to optimise it for different sounds and it really works!!

We have the hardware and software to change the way you monitor and recognise sounds.

**SoundID is all new with, no classifiers, no FFT no AI. This is not just another 80% accurate (20% inaccurate) system good for a limited number of sounds, with lots of false positives, that leaves you frustrated, but something truly professional that can recognise any sound with better than 95% accuracy . What is more it can recognise any collection of sounds of any size (that need not in any way be related).**

[See this Dawn Chorus Example !](#)

[See the Dawn Chorus Video](#)

Recognise any sound - wildlife, marine, industrial, mechanical, for artificial intelligence, robotics or whatever, at better than 100 times or more faster than real time and with an accuracy comparable to a human expert!! We can in fact recognise and quantify differences in sound that a human would entirely miss.

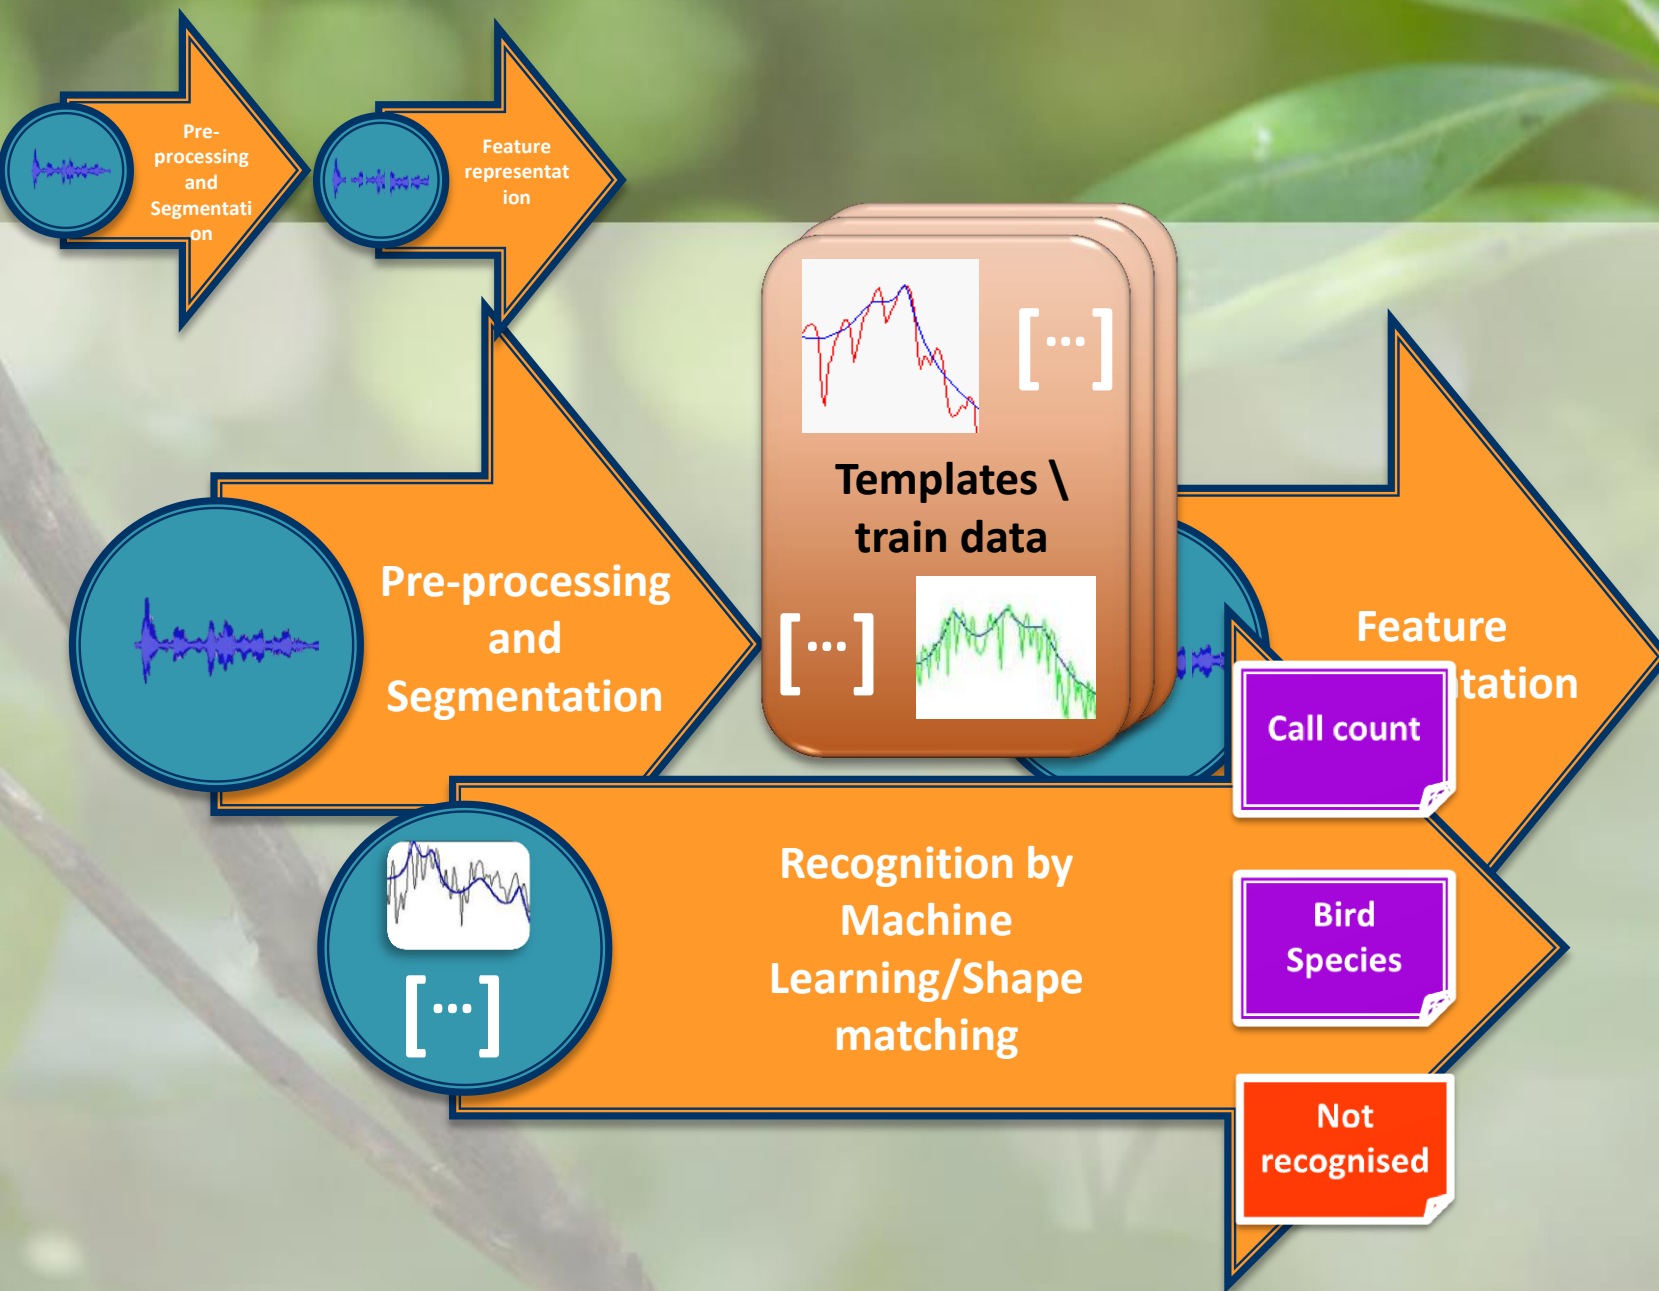

A complete suite of software tools for bioacoustics, sound recognition, professional sound analysis for the most demanding of applications. This is a specialist non-voice sound recognition application.
